

Contribution to the knowledge of the Carabid beetles of Galápagos (Ecuador).

by Konjev DESENDER, Leon BAERT and Jean-Pierre MAELFAIT

Abstract

In this contribution to the knowledge of the Carabid beetle fauna of the Galápagos (Ecuador) the distribution data are given on 19 species. This is based on material collected during our 1986-expedition and completed with data from previously unidentified material collected during some earlier expeditions as well as with all records mentioned in the literature.

Résumé

Dans cette contribution à la connaissance de la faune carabique des Galápagos (Ecuador), les données de distribution de 19 espèces sont énumérées. Ce travail est basé sur le matériel récolté lors de l'expédition belge effectuée en 1986 et est complété avec les données provenant de matériel non-identifié réuni lors d'expéditions antérieures ainsi que les données provenant de la littérature.

Galápagos - Carabidae - Distribution.

Contribution No. 431 of the Charles Darwin Research Foundation.

Introduction

During 1986, the authors spent two months (February 13 - April 5) in the Galápagos archipelago in the scope of their Invertebrate survey of the islands, started during 1982. Several papers were already published on the araneological fauna of the archipelago by the co-authors (see BAERT & MAELFAIT, 1986 and BAERT et al. in press, for references). In this paper all known data on 19 Carabid species from the archipelago are compiled until and including those from our 1986-expedition.

In this publication we mention for each of the discussed species :

- the literature references
- the material examined : besides our material collected during 1986, the first author had the opportunity to examine the collections of (1) the Charles Darwin Research Station, (2) the Belgian entomologists N. LELEUP (1964 expedition, identified) and S. JACQUEMART (1974 expedition), and of BAERT & MAELFAIT

(1982 expedition), deposited in the K.B.I.N. at Brussels (3) the specimens collected by Heinrich and Irene SCHATZ (1985 expedition, identified) during their ecological investigation of the soil invertebrates of the Galápagos Islands ;

- in each case we mention the number of males and females (if specified in literature), together with the month (in roman numbers) and the year of capture ;
- the distribution of the species over the archipelago ; the islands marked with an asterisk were not previously mentioned for the species ;
- the habitat choice of the species if this could be deduced from our captures ;
- the zoogeographic affinities as far as these are known.

Some genera of Carabid beetles occurring in the archipelago are however still incompletely or not mentioned here because we are at the time revising these species and/or complete genera : a number of species belonging to the genera *Pterostichus*, the genera *Bradyceillus*, *Selenophorus* and *Pentagonica* (a genus previously unknown to the Galápagos Islands). Separate papers will be devoted to these cases with descriptions and/or redescriptions of a number of species together with all distributional and ecological data.

Detailed descriptions of all sampling sites from our 1986 expedition are given by BAERT et al. (in press) ; all these localities are shown on a map of the archipelago (Figure 1).

Results

Agonum albemarli (VAN DYKE, 1953)

 SANTA FE : (X.1905) : (2 elytra)
 SANTIAGO : (IV.1923) : (6 ind.) ; (II.1925) : (6 ind.) ; (V.1975) : top near el Tunel (1♀) ; (VI.1975) : James Bay (elytra)

SOUTH AMERICAN MAINLAND : COLOMBIA : (1885?) (1 ind.?)

PERU : (?) : Callao ('some ind.?)

Distribution and habitat choice

Baltra, Darwin, Eden, Española, Floreana, Genovesa, Isabela, Pinta, Pinzón, Pitt*, San Cristóbal, Santa Cruz, Sante Fé, Santiago ; occurs in many habitat types, but especially abundant in the dry arid zone and transition zone at lower altitudes ; on Isabela also occurring at higher altitudes in pampa-habitats.

Zoogeographic affinities

Occurring in the entire Galápagos archipelago and probably originating from the South American main-

land, although there are no recent records there and there is some doubt on the older records.

Other material examined

SANTA CRUZ : Jacquemart 1974 : (I) : near the sea (1 ♀)

Records mentioned in literature

SANTA CRUZ : (II.1965) : near Bahia Tortuga, between detritus (4 ind.); (V.1975) : *Scalesia*-wood, between detritus (2 ind.)

Distribution and habitat choice

Santa Cruz, at different altitudes : between detritus in humid crevasses or under *Scalesia*

Zoogeographic affinities

Only known from the Galápagos ; this holds true for the entire genus.

Morphological remark

During our detailed microscopic study of the female which we discovered in the material collected by Jacquemart (1974), we remarked a number of character states which were not or unprecisely described by REICHARDT (1970). Apparently this author must have had only male specimens at hand (not mentioned in his publication), because we observed that the shape of the terminal antennal segment (the 'typical' character for

the genus) is normal-shaped in females and not spoon-shaped as in the male (cfr. etymology of the genus-name).

Furthermore, Reichardt did not mention that the entire antenna is covered by dense fine hairs ; finally, the original description states that the scutellum is apparently hidden under the elytra, whereas we could clearly observe it at the basis of the elytra. This is also the case in the (male) holotype, which we had the opportunity to check.

Material sampled in 1986

SAN CRISTOBAL (III) : Locality 101 (12 ♂ ♂ / 7 ♀ ♀), Locality 102 (13 ♂ ♂ / 29 ♀ ♀), Locality 103 : (84 ♂ ♂ / 81 ♀ ♀)

Other material examined

SAN CRISTOBAL : Jacquemart 1974 : (I) : El Junco (3 ♀ ♀); Schatz 1985 : (III) : El Junco 670 m (8 ♂ ♂ / 11 ♀ ♀), El Junco 680 m (2 ♂ ♂ / 3 ♀ ♀), Cerro San Joaquin 700 m (6 ♂ ♂ / 3 ♀ ♀), Cerro San Joaquin 740 m (3 ♂ ♂)

Records mentioned in literature

SAN CRISTOBAL : (IX?.1835) : (5 ind.); (I.1906) : (4 ind.); (V.1975) : El Junco (10 ind.); Cerro San Joaquin (60 ind.); (VI.1975) : Cerro San Joaquin (14 ind.)

Distribution and habitat choice

San Cristóbal, restricted to the highlands but there occurring in different habitats

Zoogeographic affinities

Only known from the Galápagos

Pterostichus duncani (VAN DYKE, 1953)**References**

ISABELA : Volcán Sierra Negra : (XI.1964) : at 4 km of the coast (1 ind.)

SANTA CRUZ : (I-II.1964) : CDRS, at light (32 ind.); (X.1964) : idem (1 ind.); (IX.1964-II.1965) : South-eastern slope, low altitude, at light (198 ind.); (IV-V-1975) : CDRS, at light (12 ind.); (V.1975) : Cerro Colorado at Northeastern coast (14 ind.), *Scalesia*-wood near road to Baltra (1 ind.), Santa Rosa on trail to the Caseta (1 ind.); (VI.1975) : CDRS, at light (1 ind.)

AMERICAN MAINLAND : CALIFORNIA : San Diego (1♀); HAYWARD : Colorado-river; ANTIGUA (WEST INDIES), PUERTO RICO (Ensenada); ECUADOR : (IV.1975) : Playa Tanga

Distribution and habitat choice

Baltra, Isabela, Rábida*, Santa Cruz, Santiago* ; this halophilous species is largely confined to the banks of brackish or saline water pools ; small numbers are sometimes found in other habitats at higher altitude and probably a byproduct of flight activity.

Zoogeographic affinities

Southern parts of North America, Central America, Northern parts of South America.

General Discussion

Although only 19 species (or about 50%) of the Galápagos Carabid fauna are treated in this paper, it is interesting to note that from these species no less than 17 (or nearly 90%) are endemic to the archipelago. Indeed only two species are also known from the continent, moreover found on different islands of the Galápagos archipelago, and known as both regularly and easily dispersing by flight. From the 17 endemic species, 4 only are known from more than one island and are able to fly, no less than 13 (or nearly 70%) are restricted to one island or even one volcano of the archipelago. These species, without exception, have undergone a partly or even nearly complete reduction in their flight wing development (and thus in their dispersal power). Moreover, they seem highly specialized in their habitat choice. As compared to other biotic taxocoenoses, these levels of endemism are very high indeed and show the high degree of speciation which has occurred in Carabid beetles.

Acknowledgements

This investigation was financed by (1) the Belgian Ministry of Education, (2) the National Foundation for Scientific Research (NFWO) and (3) the Léopold III foundation. We are very grateful for the generous support of these Institutions. We received excellent cooperation from the CDRS (Dir. G. Reck and his staff) and the National Park Service of the Galápagos (Intendente Ir. M. Cifuentes, Ir. H. Ochoa and Lcdo F. Cepeda). We are further indebted to Mrs. S. Sandoval and S. Abedrabbo for their valuable help in the field. We also would like to thank M. Wilson (CDRS) and Prof. G. Onoré (Univ. Catol., Quito, Ecuador) for the loan of material, and Dr. H. and Dr. I. Schatz (Austria) for their material collected during 1985.
