

A Red list for the spiders of Flanders

by Jean-Pierre MAELFAIT, Léon BAERT, Marc JANSSEN & Mark ALDERWEIRELDT

Abstract

Of the 604 spider species mentioned as occurring in Flanders only about half is at moment safe or at low risk of extinction. The extinct and threatened species occur(-red) in oligotrophic grasslands, deciduous forests, heathlands and several kinds of wetland habitats.

Key words: Red list, spiders, Flanders, Belgium, habitats

Résumé

Il n'y a, aujourd'hui, que près de la moitié des 604 espèces d'araignées connues de Flandre que l'on peut considérer comme étant à l'abri ou ne présentant qu'un faible risque de disparition. Les espèces éteintes ou menacées colonisaient ou colonisent des prairies oligotrophes, des forêts décidues, des landes à bruyère et différents types d'habitats gorgés d'eau.

Mots-clés: Liste rouge, araignées, Flandre, Belgique, biotopes

Introduction

During recent years Red lists of particular taxonomic groups became more and more indispensable tools in nature conservation research. This also holds true for Flanders. As well as for the development of a modern nature conservation policy as for their use in site assessment studies such lists summarising the present status of each involved species can be very useful instruments (ALDERWEIRELDT & MAELFAIT, 1992; MAELFAIT, 1993, 1994, 1995; MAES *et al.*, 1995; VERHEYEN *et al.*, 1994).

The study of spiders in Belgium (and Flanders) began by the end of the nineteenth century with the very luxurious books treating the occurrence of these animals in Belgium by BECKER (1882, 1896). During the fifties of the twentieth century faunistic studies were resumed by J. KEKENBOSCH (Royal Belgian Institute of Natural Sciences). It was only from the seventies onwards however that a large variety of habitats distributed over the whole of the country were sampled. This was mostly done by scientists associated with the Laboratory of Ecology (University of Gent) and, later on, with the Royal Institute of Natural Sciences and with the Institute of Nature Conservation. Amateur arachnologists also contributed a lot to that inventory work. Most of these faunistic studies were published in the newsletter of the Belgian Arachno-

logical Society (ARABEL). Distribution data were gathered per species and published in catalogues per family (ALDERWEIRELDT & MAELFAIT, 1990; BAERT, 1996; DE BLAUWE & BAERT, 1981; JACOBS, 1993; JANSSEN, 1993; JANSSEN & RAERT, 1987; RANSY & BAERT, 1985, 1987a,b, 1991a,b; RANSY *et al.*, 1987; SEGERS & BAERT, 1991; VAN KEER & VANUYTVEN, 1993). The catalogue treating the subfamily of the Linyphiinae is in preparation (BAERT, in prep). These catalogues and more recent published and unpublished observations were used to assess the status of each Flemish spider species.

Material and methods

Each species mentioned as occurring in Flanders was assigned one of the following categories. These categories agree with the classification used in the Red Data Book of Germany (BINOT *et al.*, 1998) and therefore with the criteria and categories developed by the IUCN-The World Conservation Union (column RL-C in Table 1).

- **EW:** Extinct in the wild. Species not located in the wild during the last fifty years. For the spiders of Flanders these are usually species which were only mentioned for that region by Becker and for which we have no reason to doubt the correctness of the determination by that author.
- **CR:** Critical. These are species that became very rare in our region due to a drastic reduction of their habitats. These species will go extinct if the causal factors for that habitat loss continue operating.
- **EN:** Endangered. Species, that are rare because of extensive deterioration and destruction of their habitats.
- **VU:** Vulnerable. Species, that became quite uncommon because of habitat loss during the past decades.
- **RG:** Rare geographically restricted species. These are species for which Flanders lays at the northern (N), southern (S) or western (W) limit of their geographical range.
- **IN:** Indeterminate. Species assumed to be threatened but where there is not enough information to decide which of the three above-mentioned categories is appropriate
- **IK:** Insufficiently known. Species, that are suspected but not definitely known to belong to any of the above categories, because of lack of information. Also the species mentioned to occur in Flanders doubtfully.

In Table 1, the habitat for each species of the categories EW,

Table 1. – Spider species occurring in Flanders (FL) with indication of their status and habitat choice (explanation: see text).

CR, EN and VU the habitat is characterised by means of a code. For the RG-species it is indicated if they are at the northern (N), southern (S) or western (W) limit of their geographical range. The following habitat types (and codes) were distinguished:

- **Fd:** deciduous forest
- **Fdd:** dry deciduous forest
- **Fddd:** Fdd with large quantities of dead wood in the litter layer
- **Fddo:** open Fdd with well-developed undergrowth
- **Fddv:** verges of Fdd
- **Fddvs:** southerly exposed verges of Fdd
- **Fdm:** marshy deciduous forest

- **Fdmo:** open Fdm
- **Fdmot:** open Fdm with tussocks of sedges
- **Fdw:** wet deciduous forest
- **FdwI:** Fdw rich in lichens
- **Fdwo:** open Fdw
- **Fdvw:** verges of Fdw
- **Go:** oligotrophic grassland
- **God:** dry oligotrophic grassland
- **Godb:** God with patches of bare ground
- **Godba:** God with patches of bare ground and ants
- **Godbr:** God with patches of barre ground on or close to first dune ridge
- **Godbs:** southerly exposed God with patches of bare ground
- **Godd:** God with dwarf shrubs

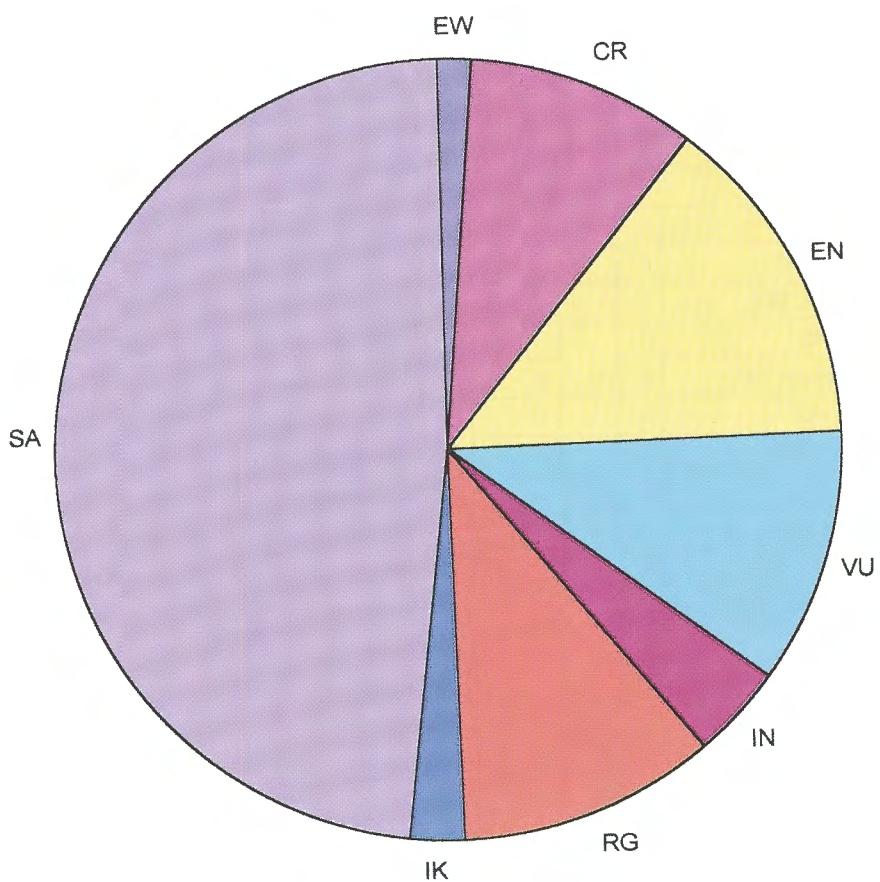

Figure 1. – Distribution of the Flemish spider species over Red list categories (explanation: see text).

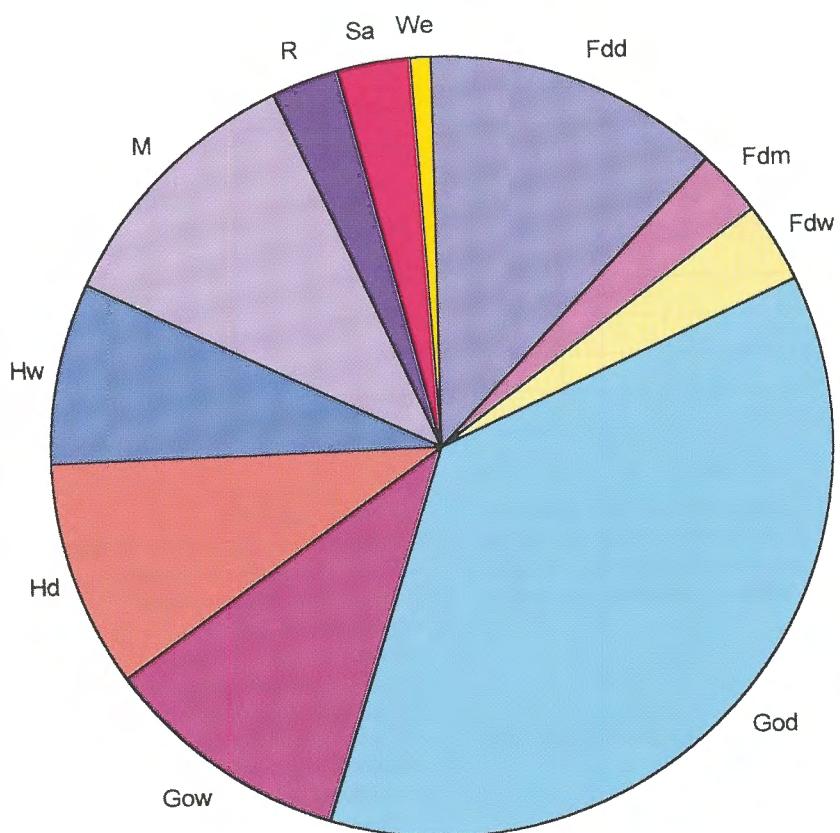

Figure 2. – Habitat distribution of the extinct and threatened Flemish spider species (explanation: see text).

- **Godds:** southerly exposed God with dwarf shrubs
- **Godf:** God rich in flowering plants
- **Godg:** short-grazed God
- **Godl:** lime-rich God
- **Godr:** God with rough vegetation
- **Godt:** God with grassy tussocks
- **Godta:** God with grassy tussocks and ants
- **Godtr:** God with grassy tussocks on or close to first dune ridge
- **Godts:** southerly exposed God with grassy tussocks
- **Gow:** wet oligotrophic grassland
- **Gowd:** Gow with dwarf shrubs
- **Gowr:** Gow with rough vegetation
- **Gowt:** Gow with tussocks
- **Hd:** dry heathland
- **Hdb:** Hd with patches of bare ground
- **Hdbs:** southerly exposed Hd with patches of bare ground
- **Hw:** wet heathland
- **Hws:** Hw with Sphagnum carpets
- **M:** marshland
- **Mc:** M with large sedges (*Carex*)
- **Mo:** oligotrophic marshland
- **Mr:** M with reed vegetation (*Phragmites*)
- **Mrr:** M with rough reed vegetation
- **R:** riparian habitat
- **Rb:** R with bare ground
- **Rg:** R with gravel
- **Rs:** sandy R
- **Sa:** saltmarsh
- **We:** eutrophic stagnant or only slow-flowing water
- **Wed:** as We, covered with floating water-plants
- **Wes:** as We, with well-developed submerged vegetation

The habitat choice of the IN- and IK-species is not characterised; the code X and Y is used respectively.

Results and discussion

In Table 1 we have listed all the spider species mentioned as occurring in Belgium. Those occurring in Flanders are indicated (FL). In Figure 1 it can be seen that of the 604 Flemish species only about half is safe or at low risk for the moment (SA). The habitat distribution of the extinct (EW) and threatened (CR, EN, VU) species is shown in Figure 2. From this figure we can deduce that the threatened part of the spider biodiversity of Flanders occurs in oligotrophic grasslands, deciduous forests, heathland and several kinds of wetland habitats. These are the habitat types prior attention should be directed to by nature conservation policy makers.
